

Seamless business flow with modernized data management

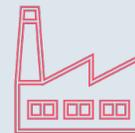

A global beverage company modernized for SAP and other business-critical workloads with Commvault technology and Accenture delivery and expertise

Challenges

- High overhead and cost with complex custom configurations.
- Increasing challenges of legacy tape solution.
- Took too long to provision resources
- Difficult to perform accurate audits in a timely manner

Solutions

- Detailed discovery phase and customer workshop
- Technical architecture based on Commvault technology plus solution validation and on-site deployment
- Dedicated resident support engineer for on-site technical support, monitoring, and management

Overview

As a global beverage company constantly transformed and evolved, they recognized the need to better protect important workloads, including SAP, as they continued to move to cloud and look for ways to drive operational efficiencies and reduce complexity. Accenture guided them with their data management approach bringing modernization-oriented changes to cut costs and improve resilience by adopting best practices, governance, metrics and reporting for their storage and backup processes.

Solution

The beverage company has been working with Accenture for more than a decade across transformation initiatives. As part of their data management modernization and application modernization effort, Commvault was brought in to provide not only the technology, but to collaborate with Accenture to deliver solutions serving their specific needs including :

Discover – Solution requirements uncovered and solidified through a detailed discovery phase and customer workshop.

Design – Create the technical architecture design using Commvault technology along with hardware and software components.

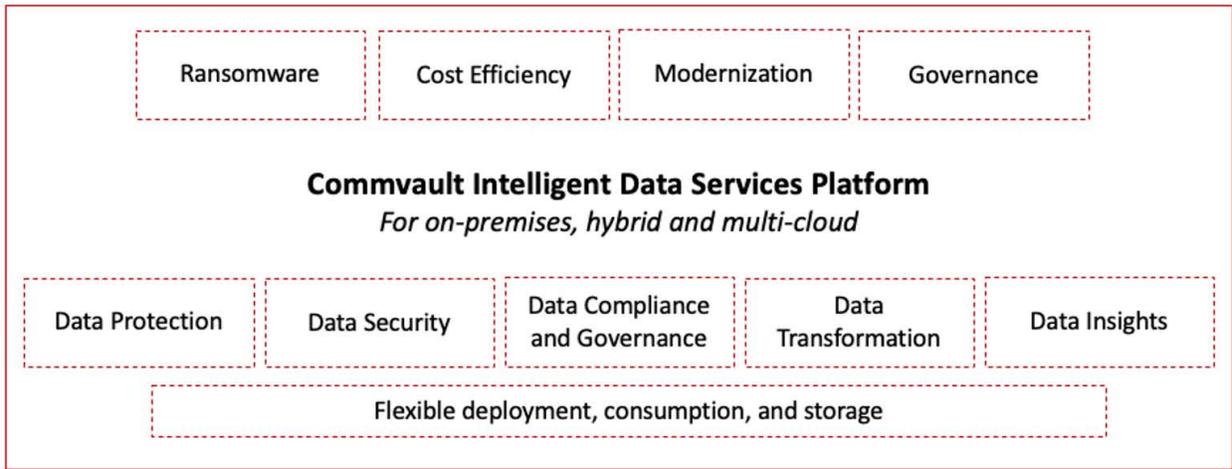

Build – Validate proposed solution design on representative hardware and ultimately deploy in the customer environment.

Maintain – Provide a dedicated resident support engineer for on-site technical support and to monitor and manage the new environment.

Outcome

Resultingly, the enterprise gained an application modernization and data management solution that rivals their other digital initiative outcomes. They standardized on a single platform that could cover their SAP workloads along with virtualized workloads on Hyper-V in Azure, Linux, Unix and mainframe, while also eliminating the need for their costly tape system. Utilizing a managed service with an on-site engineer means they never have to worry about the day-to-day operations for their data management environment going forward.
